MLflow Installation, Experiment Tracking and Data Drift Analysis

Details	Student Entry
Student Name	
Roll Number(s)	
Department / Class	
Academic Year	A.Y 2026-27
GitHub Repository URL	

1. MLflow Installation and Experiment Tracking

1.1 Environment Setup

- Operating System:
- Python Version:
- MLflow Version:
- Installation and verification status:

1.2 Experiment Tracking

- Experiment Name:
- Experiment Objective:
- Parameters, metrics or artifacts recorded:
- Brief description of successful execution:

2. Dataset Identification

2.1 Problem Statement

Briefly describe the problem addressed in the selected internship domain.

2.2 Dataset Details

- Dataset Name:
- Dataset Source:
- Number of Records:
- Important Features:
- Target Variable (if applicable):
- Use Case Category: ML / Deep Learning / Unsupervised Learning / Other AI Application

2.3 Dataset Selection Rationale

Explain why the dataset is relevant to the selected problem.

3. Drift Scenario and Detection Method

3.1 Drift Type

Identify the relevant drift type: Data Drift / Concept Drift / Prediction Drift.

3.2 Reference and Current Data

Briefly describe the datasets or model outputs compared, including whether the drift is naturally observed or simulated.

3.3 Detection Method

- Method / Statistical Test / Tool Used:
- Features or outputs analyzed:
- Detection threshold or criteria, if applicable:

4. Results, Interpretation and Conclusion

4.1 Drift Analysis Results

Summarize the important findings. Detailed screenshots, plots and reports should be maintained in GitHub.

4.2 Interpretation

Explain what the findings mean for the selected internship domain.

4.3 Conclusion and Recommended Action

State whether drift was detected, whether the result was inconclusive, or whether no significant drift was found. Mention the appropriate next action.

5. GitHub Repository and Reproducibility

- GitHub Repository URL:
- Source code / Notebook:
- README and execution instructions:
- Requirements / Dependencies:
